Assistant Commissioner for Patents

Sir:

Before calculating the filing fee, please amend the accompanying application as follows:

Please add the Abstract attached on a separate sheet.

In the Description

At Page 1, line 1, please add the following words:

This application claims the benefit of provisional application number 60/142,064 filed July 2, 1999.

In the Claims

Please cancel Claims 3, 13-15, 22, 25 and 26; enter the indicated amendments to Claims 1, 4, 6-8, 10-11, 16-21 and 23-24; and enter new Claims 28-41. Directions for amendment of claims are indicated on the copy of the attached hand amended ("marked up") original claims, showing in manuscript the amendments that have been made and the origins of the new claims. Clean forms of new and rewritten claims are included in the attached "Clean Pending Claims" document.

Remarks

This application seeks protection for certain novel compounds that are inhibitors of the serine protease, Factor Xa, and are useful for the treatment of thrombotic disorders.

Applicants now wish to amend the application to achieve three objectives:-

1. to remove improper multiple claim dependencies;
2. to distinguish the claims from the disclosures of references cited in the international search report; and
3. to avoid double patenting compounds claimed in four co-pending international applications that claim priority according to 35 U.S.C § 119(a) under 35 U.S.C § 365(b) from the international application of which this application is the national stage.

Although the amendments being made are complex, it is believed that each amendment finds support in the application, as will be described in detail below. For the assistance of the Examiner, a copy of the original claims is attached, as noted above, showing in manuscript the amendments that have been made.

Amended Claim 1 has been drafted by incorporating into original Claim 1 the limitations of Claims 3 and 22 for n and R_2 , respectively, and the structures for L_p listed at pages 19 to 27 of the description (see "Insert A" in the hand amended set of claims). Certain structures have been deleted from this list, either because they appear in compounds disclosed in the references cited in the international search report, or because they appear in compounds to be claimed in one of the four new unpublished PCT applications also assigned to Applicants' assignee, Eli Lilly and Company. In addition, Applicants have also incorporated into Claim 1 certain structures for $L-L_p(D)_n$ disclosed in the specification at pages 250 to 253 (see "Insert B" in the hand amended set of claims). It is necessary to incorporate all of the structures into Claim 1 in order to cover all of the Examples requiring protection in this application.

New Claim 28 is based upon the passage beginning after "(preferably" in Claim 22, part (i).

New independent Claim 29 has been drafted by incorporating the limitations of original Claims 3, 14, 15 and 22 into Claim 1, but excluding certain compounds claimed in original Claim 16 (see "Insert A1" in the hand amended set of claims). These excluded compounds are claimed in the four new unpublished PCT applications mentioned above.

New Claims 1 and 29 both fall within the scope of original Claim 1, and cover many of the same Examples. However, the scopes of the two new claims do not overlap entirely. Because the two new independent claims both fall within the scope of original Claim 1, and because they cover many of the same Examples, it is believed that the application still has unity.

The dependent claims correspond with dependent claims as originally filed, but some consequential amendments have been made in Claims 16 to 18. In addition, various typographical/clerical errors have been corrected.

It is therefore respectfully submitted that no new matter has been introduced by the amendments. In particular, none of the amendments has created a novel selection.

Favorable consideration of the application is requested.

Respectfully submitted,

Compounds

This invention relates to compounds which are inhibitors of serine proteases and to pharmaceutical compositions thereof and their use in the treatment of the human or animal body.

The serine proteases are a group of proteolytic enzymes which have a common catalytic mechanism characterized by a particularly reactive Ser residue. Examples of serine proteases include trypsin, tryptase, chymotrypsin, elastase, thrombin, plasmin, kallikrein, Complement C1, acrosomal protease, lysosomal protease, cocoonase, α -lytic protease, protease A, protease B, serine carboxypeptidase II, subtilisin, urokinase, Factor VIIa, Factor IXa, and Factor Xa. The serine proteases have been investigated extensively over a period of several decades and the therapeutic value of inhibitors of serine proteases is well understood.

Serine protease inhibitors play a central role in the regulation of a wide variety of physiological process including coagulation, fibrinolysis, fertilization, development, malignancy, neuromuscular patterning and inflammation. It is well known that these compounds inhibit a variety of circulating proteases as well as proteases that are activated or released in tissue. It is also becoming clear that serine protease inhibitors inhibit critical cellular processes, such as adhesion, migration, free radical production and apoptosis. In addition, animal experiments indicate that intravenously administered serine protease inhibitors, variants or cells expressing serine protease inhibitors, provide a protective effect against tissue damage.

Serine protease inhibitors have also been predicted to have potential beneficial uses in the treatment of disease in a wide variety of clinical areas such as oncology, neurology, haematology, pulmonary medicine, immunology, inflammation and infectious disease.

In particular serine protease inhibitors may be beneficial in the treatment of thrombotic diseases, asthma, emphysema, cirrhosis, arthritis, carcinoma, melanoma, restenosis, atheroma, trauma, shock and reperfusion injury.

Thus for example an inhibitor of Factor Xa has value as a therapeutic agent as an anticoagulant, e.g. in the treatment and prevention of thrombotic disorders. The use of a Factor Xa inhibitor as an anticoagulant is desirable in view of the selectivity of its effect. Many clinically approved anticoagulants have been associated with adverse events owing to the non-specific nature of their effects on the coagulation cascade.

Also, there are well-known associations of α_1 protease inhibitor deficiency with emphysema and cirrhosis and C1 esterase inhibitor deficiency with angioedema.

It has now been found that certain aromatic compounds carrying bulky lipophilic side chains are particularly effective as inhibitors of serine proteases, especially proteases with negatively charged P1 specificity pockets, and most especially the serine proteases thrombin, and most importantly Factor Xa. The Factor Xa inhibitors of this invention are potentially useful for the prophylaxis or treatment of thrombotic disorders such as amongst others venous thrombosis, pulmonary embolism, arterial thrombosis, myocardial ischaemia, myocardial infarction, and cerebral thrombosis. They potentially have benefit in the treatment of acute vessel closure associated with thrombolytic therapy

and restenosis, e.g. after transluminal coronary angioplasty or bypass grafting of the coronary or peripheral arteries and in the maintenance of vascular access patency in long term hemodialysis patients.

- 5 Factor Xa inhibitors of this invention may, with benefit, form part of a combination therapy with an anticoagulant with a different mode of action or with a thrombolytic agent.

- Hence, the invention also comprises certain compounds
10 which have been found to be inhibitors of both Factor Xa and thrombin. These compounds have excellent potential therapeutic value and may synergistically boost Fxa antithrombotic effect.

- It has been reported in WO99/11658 and WO99/11657 that
15 certain benzamidine and aminoisoquinoline derivatives carrying a bulky lipophilic side chain are excellent inhibitors of serine proteases. Unfortunately, it has since been found that benzamidine compounds of WO 99/11658 in general demonstrate poor oral bioavailability.

- 20 Surprisingly, it has now been found that certain other aromatic compounds also show inhibitory activity against serine proteases, in particular Factor Xa, despite the lack of the amidino or 1-aminoisoquinoline functionality previously believed to be crucial for activity as a factor
25 Xa inhibitor. Many of these compounds also possess other structural features that further distinguish them from the compounds of WO99/11658 and WO99/11657.

- Where compounds of the invention have been tested, they have generally demonstrated superior oral bioavailability in
30 comparison with benzamidines disclosed in WO 99/11658. Also, it has been found that the compounds of the invention perform excellently in the prothrombin time assay (PT) when

compared to aminoisoquinolines of similar factor Xa activity and structure. The PT assay is a coagulation assay and it is widely accepted that direct acting Factor Xa inhibitors which perform well in the PT assay are more likely to be good antithrombotics.

In WO99/09053 certain 2-aminobenzamide compounds are disclosed as potential motilin receptor antagonists and in US 3268513 similar 2-aminobenzamide compounds are suggested as potential antibacterial agents. However, the novel compounds of the present invention have not before been suggested as potential serine protease inhibitors.

Thus viewed from an one aspect the invention provides a serine protease inhibitor compound of formula (I)

(I)

or a physiologically tolerable salt thereof, e.g. a halide, phosphate or sulphate salt or a salt with ammonium or an organic amine such as ethylamine or meglumine.

- Compounds of formula I as defined above, but in which
- 5 R_1 is an unsubstituted aminoalkyl group are claimed in a co-pending application.

In the compounds of the invention, where the alpha atom is carbon it preferably has the conformation that would result from construction from a D- α -aminoacid

- 10 $NH_2-CR_{1b}(Cy)-COOH$ where the NH_2 represents part of X-X. Likewise the fourth substituent R_{1b} at an alpha carbon is preferably a methyl or hydroxymethyl group or hydrogen.

- In the compounds of the invention, unless otherwise indicated, aryl groups preferably contain 5 to 10 ring atoms
- 15 optionally including 1, 2 or 3 heteroatoms selected from O, N and S; alkyl, alkenyl or alkynyl groups or alkylene moieties preferably contain up to 6 carbons, e.g. C_{1-6} or C_{1-3} ; cyclic groups preferably have ring sizes of 3 to 8 atoms; and fused multicyclic groups preferably contain 8 to
- 20 16 ring atoms.

Examples of particular values for R_{1a} are: hydrogen, methyl or ethyl. R_{1a} is preferably a hydrogen atom.

- The linker group from the R_2 group to the alpha atom is preferably selected from $-CH=CH-$, $-CONH-$, $-CONR_{1a}-$, $-NH-CO-$,
- 25 $-NH-CH_2-$, $-CH_2-NH-$, $-CH_2O-$, $-OCH_2-$, $-COO-$, $-OC=O-$ and $-CH_2CH_2-$. Preferably, the X moiety nearest to the alpha atom is an NH or O atom, most preferably a NH group. The X moiety alpha to the aromatic ring is preferably a carbon based group such as CH_2 or CO, preferably CO. Thus a
- 30 particularly preferred linker X-X is $-CONH-$. In an alternative embodiment the linker is preferably a $-OCH_2-$ group.

Examples of particular values for R_{1b} are: hydrogen, (1-4C)alkyl, such as methyl or hydroxy(1-4C)alkyl, such as hydroxymethyl. R_{1b} is preferably a hydrogen atom.

The alpha atom (Y) is preferably a CH or C(CH₃) group, especially CH.

The linker group from the alpha atom to the lipophilic group is preferably CO, CH₂NH, CONR_{1d}(CH₂)_m, (CH₂)_mN(R_{1d})CO(CH₂)_m, (CH₂)_{m+2}, CO(CH₂)_m, (CH₂)_mCO, (CH₂)_mOC=O, (CH₂)_mO, CH=CH(CH₂)_m, SO₂, SO₂NR_{1d}, SO₂(CH₂)_m, (CH₂)_mSO₂ or (CH₂)_mSO₂NR_{1d} (where each m is independently 0 or 1 and R_{1d} is as defined for R_{1a}).

Examples of particular values for R_{1d} are: hydrogen; for alkyl optionally substituted by hydroxy, alkylamino, alkoxy, oxo, aryl or cycloalkyl: (1-6C)alkyl, such as methyl or ethyl, or aryl(1-6C)alkyl, such as benzyl or phenylethyl; for aminoalkyl optionally substituted by hydroxy, alkylamino, alkoxy, oxo, aryl or cycloalkyl: (2-6C)carboxamido, such as carboxamidomethyl; for hydroxyalkyl optionally substituted by hydroxy, alkylamino, alkoxy, oxo, aryl or cycloalkyl: (1-6C)carboxyalkyl, such as carboxymethyl, carboxyethyl or carboxypropyl; for alkoxyalkyl optionally substituted by hydroxy, alkylamino, alkoxy, oxo, aryl or cycloalkyl: (1-5C)alkoxycarbonyl(1-6C)alkyl, such as methoxycarbonylmethyl, methoxycarbonylethyl, methoxycarbonylpropyl, ethoxycarbonylmethyl, ethoxycarbonylethyl and ethoxycarbonylpropyl.

R_{1d} is preferably a hydrogen atom.

The linker may be optionally branched, for example, to incorporate a polar functionality.

Examples of particular values for L are CO, CONH, CH₂NHCO and CONHCH₂.

It will be appreciated by those skilled in the art that a diverse range of organic groups are lipophilic, and that it is therefore impractical to define with precision each and every structure that may be incorporated into a serine protease inhibitor according to the invention. Accordingly, it is being assumed that the addressee of this specification will not require an exhaustive computer listing of

structures of lipophilic groups, but will instead make use of the structures of lipophilic groups disclosed in the specification, especially those exemplified; the test systems described herein for identifying serine protease inhibitors; and common general knowledge of the lipophilicity, synthesis and stability of organic compounds, to obtain novel serine protease inhibitor compounds of formula (I).

The lipophilic group may be, for example, an alkyl, alkenyl, carbocyclic or heterocyclic group, or a combination of two or more such groups linked by a spiro linkage or a single or double bond or by C=O, O, S, SO, SO₂, CONR_{1e}, NR_{1e}-CO-, NR_{1e} linkage (where R_{1e} is as defined for R_{1a}), optionally substituted by one or more oxo or R₃ groups in which R₃ is as defined for R_{3a}.

By way of illustration, representative lipophilic groups include methylcyclohexyl, methylcyclohexylmethyl, methylphenylmethyl, phenylethyl, benzylpiperidinyl, benzoylpiperidinyl, bispiperidinyl and phenylpiperazinyl.

Phenylethyl is an example of a combination of an alkyl group and a carbocyclic group linked through a single bond.

Benzylpiperidinyl is an example of a combination of an alkyl group, a carbocyclic group and a heterocyclic group linked by single bonds.

5 Benzoylpiperidinyl is an example of a combination of a carbocyclic group and a heterocyclic group linked through C=O.

10 Methylcyclohexylmethyl is an example of a combination of an alkyl group (methyl) and a carbocyclic group (cyclohexyl) linked by a single bond and having a substituent R_3 (methyl) on cyclohexyl. It will be appreciated that this group could alternatively have been regarded as a combination of two alkyl groups and a carbocyclic group. However, in order to provide clarity, in this specification any terminal alkyl group in L_p will be
15 treated as a substituent R_3 .

When the lipophilic group comprises an alkyl group, this may be, for example, a (1-3C) alkyl group, such as methyl, ethyl or propyl. Preferably an alkyl group is unsubstituted.

20 When the lipophilic group comprises a carbocyclic group, this may be, for example, a non-aromatic or aromatic, mono or polycyclic hydrocarbon group containing up to 25, more preferably up to 10 carbon atoms. The carbocyclic group may thus be, for example, a cycloalkyl, polycycloalkyl,
25 phenyl or naphthyl group, or a cycloalkyl group fused with a phenyl group.

Examples of particular values for a cycloalkyl group are (3-6C) cycloalkyl groups, such as cyclopentyl and cyclohexyl. A cycloalkyl group is preferably unsubstituted
30 or substituted by one group R_3 , preferably amino or an alkyl group, such as methyl.

Examples of particular values for a polycycloalkyl group are (6-10C) polycycloalkyl groups, such as bicycloalkyl, for example decaliny, norbornyl or adamantyl. A polycycloalkyl group is preferably unsubstituted.

5 A phenyl group is preferably unsubstituted or substituted by one or two R_3 groups. More preferably it is substituted by one or two R_3 groups.

A naphthyl group is preferably unsubstituted or substituted by one R_3 group.

10 Examples of a cycloalkyl or cycloalkenyl group fused with a phenyl group are indanyl and tetrahydronaphthyl. This group is preferably unsubstituted.

When the lipophilic group comprises a heterocyclic group, this may be, for example, a non-aromatic or aromatic,
15 mono or polycyclic group containing one or two oxygen, nitrogen or sulfur atoms in the ring system, and in total up to 25, more preferably up to 10 ring system atoms.

Examples of a heterocyclic group when it is a non-aromatic monocyclic group are azacycloalkyl groups, such as
20 pyrrolidinyl and piperidinyl; azacycloalkenyl groups, such as pyrrolinyl; diazacycloalkyl groups, such as piperazinyl; oxacycloalkyl groups, such as tetrahydropyranyl; and thiacycloalkyl groups, such as tetrahydrothiopyranyl. A non-aromatic monocyclic group preferably contains 5, 6 or 7 ring
25 atoms and is preferably unsubstituted or substituted by one group R_3 , preferably alkyl, such as methyl or ethyl, or hydroxyalkyl, such as hydroxymethyl.

Examples of a heterocyclic group when it is a non-aromatic polycyclic group are bicyclic groups, such as
30 azacycloalkyl fused with phenyl, for example dihydroindolyl, dihydroisindolyl, tetrahydroquinolinyl and tetrahydroisoquinolinyl; and tricyclic groups, such as

azacycloalkyl fused with indolyl, for example tetrahydropyrido[3,4-b]indole. This group is preferably unsubstituted.

5 Examples of a heterocyclic group when it is a aromatic monocyclic group are furyl, pyrrolyl, thienyl, imidazolyl, pyridyl, pyridazinyl, pyrimidinyl, pyrazinyl, oxazolyl, oxadiazolyl (such as 1,3,4-oxadiazolyl), thiadiazolyl (such as 1,3,4-thiadiazolyl) and thiazolyl. This group is preferably unsubstituted or substituted by one R_3 .

10 Examples of a heterocyclic group when it is an aromatic polycyclic group are bicyclic groups such as benzofuryl, quinolinyl, isoquinolinyl and benzothienyl. This group is preferably unsubstituted or substituted by one R_3 .

15 The lipophilic group preferably comprises a cycloalkyl, azacycloalkyl, diazacycloalkyl, phenyl, naphthyl, adamantyl, bicycloalkyl, mono- or diazabicycloalkyl, mono- or bicyclo heteroaromatic or a linear or branched alkyl or alkenyl group all optionally substituted by one or more groups R_3 , or a combination of at least two such groups linked by a
20 spiro linkage or a single or double bond or by C=O, O, S, SO, SO₂, CONR_{1e}, NR_{1e}-CO- or NR_{1e} linkage (where R_{1e} is as defined for R_{1a}).

Where Lp comprises a combination of at least two groups, it preferably comprises a combination of two or
25 three such groups. The groups are preferably linked by a single bond, C=O, O or NR_{1e}.

Of particular interest are compounds of formula I in which Lp comprises an azacycloalkyl or diazacycloalkyl group of formula

in which r is 1 or 2, one of X_a and X_b is N and the other is CH or N, provided that when r is 1, X_a and X_b are not both N.

- 5 Preferred compounds comprising this group are those in which L_p is a group of formula:

in which:

r is 1 or 2;

- 10 one of X_a and X_b is N and the other is CH or N provided that when r is 1, X_a and X_b are not both N;

s , t and u are each 0 or 1;

L_a and L_b are each independently selected from a single bond, C=O, O and NR_{1e} , in which R_{1e} is hydrogen or (1-

- 20 unsubstituted or substituted by one or two R_3 groups; pyrrolinyl; or a group of formula

in which v is 1, 2 or 3; one of X_c and X_d is N and the other is CH or N, provided that when v is 1, X_c and X_d are not

both N; and R₁₁ is hydrogen, (1-6C)alkyl or when X_d is CH, hydroxy(1-6C)alkyl; provided that when t is 0, the sum of s and u is 1; when X_b is N, L_a is a bond or C=O; when X_c is N, L_b is a bond or C=O; when X_b and X_c are both N, t is 1; and
5 when (L_a)_s-(G)_t-(L_b) represents an alkyl group and X_b and X_c both represent N, the alkyl group contains at least two chain carbon atoms.

It will be appreciated that the provisos exclude compounds having two heteroatoms bonded directly together or
10 separated by an alkyl group having only one carbon atom in the chain.

When X_a is N, L is preferably CO or CH₂CO.

When X_a is CH, L is preferably CONH, CONHCH₂ or CH₂NHCO.

wherein R_3 is as hereinbefore defined;

m represents 0 or 1;

R_4 represents hydrogen, $(CH_2)_wCOOH$ or $(CH_2)_wCONH_2$;

w represents an integer from 0 to 4; and

X represents CH or N.

Where two or more X atoms are present in a ring,

preferably at least one is CH.

When R_3 is present as a substituent on an aromatic ring, it is preferably selected from hydrogen,

alkylsulphonyl, aminosulphonyl, alkylaminosulphonyl,

alkylaminocarbonyl, amino, amido, alkoxycarbonyl,

acetylamino, chloro, fluoro, cyano, methoxy, ethoxy, nitro, hydroxy, alkylsulphonylamino, triazolyl and tetrazolyl.

When R_3 is present as a substituent on a saturated ring, it is preferably selected from hydrogen, hydroxy,

amino, (1-3C)alkoxy, (1-3C)hydroxyalkyl, (1-3C)alkyl,

carboxy, methoxycarbonyl and ethoxycarbonyl.

One group of lipophilic groups L_p is that of formula

in which L_x represents O or NH.

For example specific lipophilic groups include

where R_8 is as defined for R_3 (preferably as defined for a
 5 substituent on an aromatic ring), especially where R_8
 represents H, OMe, SO_2Me , F, cyano, amido, amino, NO_2 , Cl or

 or 2-propyl).

Another highly preferred lipophilic group is of formula

wherein A represents N or CH (preferably N) and R_3 is as
 15 hereinbefore defined. When the lipophilic group is (DP) it
 is preferred that the group L represents CO, CH_2 or SO_2 .
 Also, it is preferred if the R_3 groups in the formula DP are
 hydrogen.

Hence, preferred compounds of the invention are those of formula (J)

where R_2 , X-X, and Cy are as hereinbefore defined and L represents CO, CH_2 or SO_2 .

Another highly preferred lipophilic group is based on the formula (K)

wherein X_2 is halo, hydrogen, amino, nitro or $CONH_2$.

Preferably X_2 is hydrogen or fluoro. Compounds in which the lipophilic group is based on the formula (K) or (J) have been found to perform relatively well in the prothrombin time assay, when compared with corresponding aminoisoquinolines of WO99/11657.

The hydrogen bond donor group which may be attached to the lipophilic group preferably has a nitrogen or oxygen atom as the hydrogen bearing donor atom and conveniently is a hydroxyl group, a primary, secondary or tertiary amine, or a primary or secondary imine group (as part of an amidine or guanidine) or a saturated or unsaturated heterocyclic group containing a ring nitrogen, preferably a group containing 5 to 7 ring atoms. Where the donor atom is a ring nitrogen, the remote portion of the heterocyclic ring may be part of the lipophilic group.

The cyclic group attached to the alpha carbon is preferably an optionally R_{3a} substituted phenyl, pyridyl (such as pyrid-2-yl, pyrid-3-yl or pyrid-4-yl), thienyl (such as thien-2-yl or thien-3-yl), thiazolyl (such as thiazol-2-yl, thiazol-4-yl or thiazol-5-yl), naphthyl (such as naphth-1-yl), piperidinyl (such as piperidin-4-yl) or cycloalkyl, such as a cyclohexyl group.

In one embodiment the aromatic R₂ group is an optionally substituted phenyl, naphthyl, indolyl or isoindolyl group and accordingly, preferred compounds of the invention are of formula (II)

5

wherein R₅ is hydrogen, amino or hydroxy and R₃ (in relation to R₂) is halo, haloalkoxy, haloalkyl, cyano, nitro, amino, hydrazido, alkylthio, alkenyl, alkynyl or R_{1j}.

10 In a particularly favoured embodiment the R₂ group is an indole as marked by a * above in which R₅ is hydrogen and R₃ is a hydrogen or halogen present at the 3 position.

It is preferred that at least one of R₆ and R₇ be other than hydrogen and that R₆, if present, is preferably a substituent containing one or more polar hydrogens such as hydroxy, amino, alkylamino, alkylaminoalkyl, aminocarbonyl, 15 alkylaminocarbonyl, hydrazo and alkylhydrazo; alternatively R₆ and R₇ are joined together in the formation of a naphthyl or indolyl or azaindolyl or diazaindolyl group.

It is especially preferred that R₆ be amino and R₇ be 20 chloro, bromo, methyl, methoxy or vinyl; or that R₆ and R₇ taken together form an indolyl ring with the NH at the 6-position or taken together form a naphthyl ring.

In a further preferred embodiment the compounds of the invention are of formula (A)

(A)

(wherein R₅, R₆, R₇, Ar, X-X, L_{p1}, D_n are as hereinbefore defined; L₂ is a valence bond or an organic linker group containing 1 to 3 backbone atoms selected from C, N, O and S and R_{8a} and R_{9a} are hydrogen or taken together with the carbon atom to which they are attached form a carbonyl group). Again, in an alternative embodiment the phenyl derivative forming part of the R₂ functionality may instead be a nitrogen heterocyclic group, e.g. pyridine.

In one embodiment, L₂ comprises the backbone of an alpha amino acid, the lipophilic group being the side chain of the amino acid.

In one preferred embodiment R_{8a} and R_{9a} are hydrogen and L₂ is a OC=O or NHC=O group.

In a preferred embodiment, L₂ represents a valence bond and the lipophilic group is bound directly to a carbonyl alpha to the alpha atom via a nitrogen atom which forms part of the lipophilic group. Suitable lipophilic groups in this case therefore include piperidinyl, pyrrolidinyl and piperazinyl. In a preferred embodiment the piperidine or piperazinyl group is further substituted by a phenyl, benzyl, phenoxy, piperidine, pyridine or benzoyl group, optionally substituted on the phenyl ring by one or more R₃ groups. In a more preferred embodiment a piperazine is

substituted with a phenyl group substituted at the 2-position with an electron withdrawing group such as fluoro, nitro, triazolyl, cyano, alkoxycarbonyl, aminocarbonyl, aminosulphonyl, alkylaminosulphonyl and, especially preferred, alkylsulphonyl; and, at the 4-position, with hydrogen, fluoro, alkoxy or hydroxy. In another more preferred embodiment a piperidine is substituted at the 4-position with 4-piperidine which itself may be substituted on nitrogen by alkyl or aminocarbonylalkyl or alkylaminocarbonyl alkyl.

In a further embodiment, the lipophilic group has attached a group of the formula $-COOR_{1g}$ or $-CON$ -aminoacid or ester derivative thereof (where R_{1g} is as defined for R_{1a}). Particularly preferred compounds are those of formula (G)

(G)

(wherein Ar, R_6 and R_7 are as hereinbefore defined, R_5 represents hydrogen or amino and

represents a cyclic group) or of formula (H)

(H)

(wherein R_6 and R_7 are as hereinbefore defined, and R_5 represents hydrogen or amino). In a preferred embodiment R_6 is amino and R_7 a halogen, especially chlorine.

Again, in an alternative embodiment the phenyl derivative forming part of the R_2 functionality in formulae (G) and (H) may instead be a nitrogen heterocyclic group, e.g. pyridine, indole.

In another embodiment the group binding the alpha carbon atom to the lipophilic group comprises a heterocyclic group. Accordingly, preferred compounds of the invention also include those of formula (III)

(III)

(wherein R_5 , R_6 , R_7 , Ar, X-X, Lp_1 , D_n are as hereinbefore defined;

m is 0, 1 or 2;

Het is a 5 or 6-membered heterocyclic group interrupted by 1, 2 or 3 heteroatoms selected from O, N and S optionally substituted by a group R_{3b} where R_{3b} is as defined for R_3).

Again, in an alternative embodiment the phenyl

- 5 derivative forming part of the R_2 functionality may instead be a nitrogen heterocyclic group, e.g. pyridine.

Where Het is a five membered ring, the two ring atoms at which it is connected are preferably separated by one ring atom. Where Het is a six-membered ring, the two ring atoms at which it is connected are preferably separated by one or two ring atoms. Representative heterocyclic groups include thiazole, oxazole, oxadiazole, triazole, thiadiazole or imidazole. Where the heterocyclic group is substituted by R_{3b} this is preferably a COOH or COOR_{1h} connected to the heterocycle via a valence bond or alkylene chain (where R_{1h} is as defined for R_{1a}).

In a further embodiment, the lipophilic group has attached a group of the formula -COOR_{1g} or -CON-aminoacid or ester derivative thereof.

- 20 In an alternative embodiment, the main aromatic R_2 ring in the compounds of the invention is a five membered aromatic ring leading to compounds of formula (IV) or (IVa)

(IV)

(IVa)

(wherein R₅, R₆, R₇, X-X, Ar, L₁, Lp₁, D and n are as
 hereinbefore described for formula (II) and Z represents N,
 O or S). It is preferred that at least one of R₆ and R₇ be
 other than hydrogen, or that R₆ and R₇ taken together enable
 the formation of an indolyl, or azaindolyl group or
 diazaindolyl group. Preferences for other substituents are
 as for formula (A) above. Examples of possible fused
 systems are given below.

Hence in a preferred embodiment the compounds of the invention are of formula C or D

(wherein R_5 , R_6 , R_7 , Ar , $X-X$, Z , R_8 , R_9 , L_2 , Lp_1 , D_n are as hereinbefore defined) preferences for Ar , $X-X$, R_{8a} , R_{9a} , L_2 , Lp_1 , D_n are as for formula (A) above; or compounds of formula E or F:

51

(F)

wherein Lp_1 is connected to the carbonyl via a nitrogen atom, R_6 , R_7 , Ar , Z , Lp_1 , D_n are as hereinbefore defined and R_5 is hydrogen or amino) preferences for Ar , Lp_1 , D_n are as for formula (A) above.

Particularly preferred are the compounds of formula I of Examples 35, 63, 66, 73, 100, 318 and 320, and physiologically tolerable salts thereof.

As previously mentioned, a number of compounds of the invention have been found to be excellent mixed inhibitors in that they inhibit both the serine proteases Factor Xa and thrombin. Such mixed inhibitors are preferably based on the formula (L)

(L)

wherein R' represents

X_3 represents hydrogen or a polar group such as amino or CONH_2 , especially CONH_2 ; and

- 5 R'' represents a cyclic group bound to the carbonyl by a nitrogen atom or an optionally substituted group of formula

- The compounds of the invention may be prepared by
- 10 conventional chemical synthetic routes or by routes as illustrated by the following examples, e.g. by amide bond formation to couple the aromatic function to the alpha atom and to couple the lipophilic function to the alpha atom. Where the alpha atom is a carbon, the cyclic group-alpha
- 15 atom combination may conveniently derive from an alpha amino

- acid with the aromatic deriving from for example an acid derivative of a compound based on R_2 , e.g. o-amino-benzoic acid. Amide formation from such reagents (in which any amino or hydroxyl function may if desired be protected
- 5 during some or all of the synthesis steps) yields a compound of formula (V).

- 10 (where Cy and R_2 are as defined above).

- The lipophilic group (and optionally simultaneously the hydrogen bond donor) may then conveniently be introduced by reaction of a compound of formula (V) (or another analogous carboxylic acid) optionally after transformation into an
- 15 activated form, e.g. an acid chloride or active ester, with a lipophilic group carrying an amine, hydroxylamine, hydrazine or hydroxyl group, e.g. to produce compounds with linkages of $\text{-CO-NR}_{1d}\text{-}$, $\text{-CO-NR}_{1d}\text{-O-}$, $\text{-CO-NR}_{1d}\text{-NR}_{1d}\text{-}$ and -CO-O- from the alpha atom (where it is a carbon) to the
- 20 lipophilic group. Cyclisation can be base induced via nucleophilic attack of the alpha atom on a leaving group on the active side chain. If necessary the amide linkage can be reduced using an appropriate reducing agent employing the necessary protection depending on whether concurrent
- 25 reduction of the carboxylic acid moiety is also desired. Alternatively a compound of formula V or another analogous carboxylic acid may be transformed into an alcohol by reaction with isobutylchloroformate and reduction with sodium borohydride.
- 30 Such an alcohol, e.g. of formula VI

can be reacted to introduce the lipophilic group by reactions such as:

alkylation with an alkyl halide in the presence of a base;

under Mitsunobu conditions, such as reaction with diethyl azodicarboxylate/triphenylphosphine and a hydroxylated aryl compound;

by reaction with an activated carboxylic acid (e.g. an acid chloride) or with a carboxylic acid and diethylazodicarboxylate/triphenylphosphine;

by reaction with an isocyanate; and

by treatment with methanesulphonyl chloride or trifluoromethanesulphonic anhydride and reaction with an amine, or with a thiol optionally followed by oxidation, e.g. with potassium metaperiodate or hydrogen peroxide.

Alternatively, the reactions described above may be performed on a corresponding compound of formula (VI) in which R_2 is replaced with a protecting group, such as t-butoxycarbonyl (Boc), followed by deprotection and introduction of the group R_2 .

In this way compounds with linkages of $-\text{CH}_2-\text{O}-$, $-\text{CH}_2-\text{O}-\text{CO}-$, $-\text{CH}_2-\text{O}-\text{CO}-\text{NR}_1\text{d}-$, $-\text{CH}_2-\text{NR}_1\text{d}-$, $-\text{CH}_2-\text{S}-$, $-\text{CH}_2-\text{SO}-$ and $-\text{CH}_2-\text{SO}_2-$ between the alpha carbon and the lipophilic group may be produced.

Alternatively the alcohol can be oxidized to form a corresponding aldehyde (e.g. by oxidation with manganese dioxide or DMSO/oxalyl chloride or DMSO/ SO_3 or Dess-Martin reagent) which may be reacted to introduce the lipophilic group by reactions such as:

reaction with Wittig reagents or Horner-Emmons reagents, optionally followed by reduction of the resulting carbon:carbon double bond using H_2/Pd -carbon;

reaction with an organometallic, eg a Grignard reagent, optionally followed by reaction on the resulting hydroxyl group, such as oxidation (eg with MnO_2 , DMSO/oxalyl chloride or Dess-Martin reagent), alkylation (eg with an alkyl halide in the presence of a base in a solvent such as DMF), arylation (eg with diethylazo dicarboxylate/triphenyl phosphine and a hydroxyaryl compound), ester formation (eg with an acid chloride or with a carboxylic acid and diethylazido dicarboxylate/triphenyl phosphine), or carbamate formation (eg with an isocyanate);

by reaction with an amine followed by reduction, e.g.

with sodium cyanoborohydride;

by reaction with a hydrazine; or

by reaction with a carbazide.

In this way compounds with linkages of $-CH=CR_{1d}-$, $-CH_2-CHR_{1d}-$, $-CHOH-$, $-CHR_{1d}-O-$, $-CHR_{1d}-O-CO-$, $-CHR_{1d}-O-CO-NR_{1d}-$, $-CO-$, $-CH_2-NR_{1d}-$, $-CH=N-NR_{1d}-$ and $-CH=N-NR_{1d}-CO-NR_{1d}-$ between the alpha carbon and the lipophilic group may be produced.

The transformation of alcohol to amine referred to above may be used to produce an amine reagent for lipophilic group introduction, e.g. a compound

Such an amine reagent may be reacted to introduce the lipophilic group, e.g. by acylation with an acid halide or activated ester, by reaction with isocyanate, by reaction with an isothiocyanate, or by reaction with a sulphonyl chloride. In this way compounds with linkages of $-CH_2NR_{1d}-CO-$, $-CH_2-NR_{1d}-CO-NR_{1d}-$, $-CH_2NR_{1d}-CS-NR_{1d}-$ and $-CH_2NR_{1d}-SO_2-$

between the alpha carbon and the lipophilic groups may be produced.

The transformation of acid to amide referred to above may be used to produce an amide reagent for introduction of
5 the lipophilic group, e.g. a compound

Such amides may be reacted to introduce lipophilic groups, e.g. by reaction with a haloketone (e.g. phenacyl bromide). This provides a linkage

from alpha carbon to lipophilic group.

Analogously the amide may be transformed to a thioamide by reaction with Lawesson's reagent and then reacted with a haloketone to form a linkage

The amide reagent may likewise be transformed to a nitrile reagent by dehydration, e.g. with trifluoroacetic anhydride. The nitrile reagent may be reacted with hydrazine then with acyl halide and then cyclized, (e.g. with trifluoroacetic
20 anhydride) to produce a linkage

Alternatively it may be treated with hydroxylamine then reacted with acyl halide and cyclized (e.g. with trifluoroacetic anhydride) to produce a linkage

The hydrazide produced by reaction of a carboxylic acid reagent with hydrazine discussed above may likewise be used as a reagent for lipophilic group introduction, e.g. as a compound of formula

Thus the hydrazide reagent can be reacted with an acyl halide and cyclized, e.g. with trifluoroacetic anhydride to yield a linkage

or reacted with an acyl halide or an isocyanate to yield linkages $\text{-CO-NR}_{1d}\text{-NR}_{1d}\text{-CO-}$ and $\text{-CO-NR}_{1d}\text{-NR}_{1d}\text{-CO-NR}_{1d}\text{-}$ respectively.

Alternatively the hydrazide may be transformed by reaction with Lawesson's reagent and then reacted with an acyl halide and cyclized (e.g. with trifluoroacetic anhydride) to produce the linkage

An alternative route to these compounds is to carry out any of the above chemical reactions to incorporate the lipophilic group (and optional H bond donor) into a protected intermediate such as a compound of formula (VII).

PG = Protecting group

The protecting group may then be removed before coupling of the for example o-amino benzoic acid (optionally protected).

The protection of amino and carboxylic acid groups is described in McOmie, Protecting Groups in Organic Chemistry, Plenum Press, NY, 1973, and Greene and Wuts, Protecting Groups in Organic Synthesis, 2nd. Ed., John Wiley & Sons, NY, 1991. Examples of carboxy protecting groups include C₁-C₆ alkyl groups such as methyl, ethyl, t-butyl and t-amyl; aryl(C₁-C₄)alkyl groups such as benzyl, 4-nitrobenzyl, 4-methoxybenzyl, 3,4-dimethoxybenzyl, 2,4-dimethoxybenzyl, 2,4,6-trimethoxybenzyl, 2,4,6-trimethylbenzyl, benzhydryl and trityl; silyl groups such as trimethylsilyl and t-butyldimethylsilyl; and allyl groups such as allyl and 1-(trimethylsilylmethyl)prop-1-en-3-yl.

Examples of amine protecting groups (PG) include acyl groups, such as groups of formula RCO in which R represents C₁₋₆ alkyl, C₃₋₁₀ cycloalkyl, phenyl C₁₋₆ alkyl, phenyl, C₁₋₆ alkoxy, phenyl C₁₋₆ alkoxy, or a C₃₋₁₀ cycloalkoxy, wherein a phenyl group may be optionally substituted, for example by one or two of halogen, C₁-C₄ alkyl and C₁-C₄ alkoxy. Preferred amino protecting groups include benzyloxycarbonyl (CBz), t-butoxycarbonyl (Boc) and benzyl.

Compounds of the type (VII) made be prepared (for example) by one or more of the following methods.

(i) from aryl or heteroaryl aldehydes via the Strecker synthesis or modifications thereof, via Bucherer-Bergs

hydantoin synthesis, or via the Ugi methodology (Isonitrile Chemistry, Ugi I. Ed.; Academic: New York, 1971; pp145-199) with removal and replacement of protecting groups;

(ii) from styrenes via Sharpless methodology (J. Am. Chem. Soc. 1998,120, 1207-1217)

(iii) from aryl boronic acids via Petasis methodology (Tetrahedron, 1997, 53, 16463-16470) with removal and replacement of protecting groups;

(iv) from aryl and heteroaryl acetic acids - via Evan's azidation (Synthesis, 1997, 536-540) or by oximation, followed by reduction and addition of protecting groups; or

(v) from existing aryl glycines by manipulation of functional groups, for example, alkylation of hydroxy groups, palladium assisted carbonylation of triflates derived from hydroxy groups and further manipulation of the carboxylic esters to give carboxylic acids by hydrolysis, carboxamides by activation of the carboxylic acid and coupling with amines, amines via Curtius reaction on the carboxylic acid or

(vi) from aliphatic, carbocyclic and non-aromatic heterocyclic aldehydes and ketones using a Horner-Emmons reaction with N-benzyloxycarbonyl)- α -phosphonoglycine trimethyl ester (Synthesis, 1992, 487-490).

A starting reagent for lipophilic group introduction where the alpha atom is nitrogen may be produced for example by reaction of a beta protected hydrazine (such protection to be chosen as to be compatible with the subsequent reagents to be employed) with phosgene, diphosgene, triphosgene or N,N'-carbonyl diimidazole to give a reactive compound of the type:

PG = Protecting group

This intermediate may be used as has been described above for the carboxylic starting reagents where the alpha atom is carbon.

Removal of the protecting group by standard methods and coupling with an activated aryl carboxylic acid will give compounds of the type

(where R_2 , X, Y, Cy, L, Lp and D are as defined above).

Thus viewed from a further aspect the invention provides a process for the preparation of a compound according to the invention which process comprises coupling a lipophilic group to a compound of formula (VIII)

(wherein R_2 , X, Y and Cy are as defined above and Z_1 is a reactive functional group), and optionally subsequently coupling a hydrogen bond donor group to said lipophilic group.

Instead of introducing the group $\text{L}-\text{Lp}(\text{D})_n$ as the final stage process step, the compounds of formula I may alternatively be prepared by a process in which the group R_2 is introduced in the final process step.

Thus viewed from another aspect the invention provides a process for the preparation of a compound according to the invention which process comprises coupling a lipophilic group to a compound of formula (IX)

5

(wherein Y, Cy, L, Lp D, and n are as defined above and Z₂ is HX or a reactive functional group), or a protected derivative thereof, with a compound of formula (X)

10

(wherein R₂ is as defined above and Z₃ is XH or an appropriate reactive group), or a protected derivative thereof, followed if necessary by the removal of any protecting groups.

15

Thus, for a compound of formula I in which X-X represents CONH, a compound of formula (IX) in which Z₂ is H₂N may be reacted with a compounds of formula (X) in which Z₃ is COOH or a reactive derivative thereof, such as a acyl halide or an anhydride, for example as described in the Examples herein.

20

Where the lipophilic group Lp comprises more than one group, it may generally be formed by coupling these groups together at an appropriate stage in the preparation of the compound of formula I using conventional methods or as described in the Examples.

25

For a compound of formula I in which Lp comprises an azacycloalkyl or diazacycloalkyl group of formula

in which X_b is N and each of s and u is 0, alkylating the amino group of a corresponding compound in which the corresponding residue is of formula

using a conventional alkylating method. The alkylation may be carried out using any conventional method; however, generally preferred is a reductive alkylation using the appropriate aldehyde or ketone, for example as described in the Alkylation Methods in the Examples.

Thus, a particular starting material for the alkylation is one of formula

in which X_a is N and L is CO or X_a is CH and L is CONH, CONHCH₂ or CH₂NHCO.

For a compound of formula I in which L_p comprises an azacycloalkyl or diazacycloalkyl group of formula

in which R_{10} is a group of formula

in which X_d is N and R_{11} is (1-6C)alkyl, alkylating the amino group of a corresponding compound of formula I in which R_{11} is hydrogen using a conventional method.

- 5 Generally preferred is a reductive alkylation using the appropriate aldehyde or ketone, for example as described in the Alkylation Methods in the Examples.

For a compound of formula I in which Lp comprises an azacycloalkyl or diazacycloalkyl group of formula

10

in which X_b is CH and $(L_a)_s-(G)_t-(L_b)_u$ is O and R_{10} is phenyl or pyridyl, coupling a corresponding compound containing a

15 group of formula

with phenols or 3-hydroxypyridine using Mitsunobu conditions, eg. DEAD (diethyl azodicarboxylate) / Ph_3P or 2-triphenylphosphonium 4,4-dimethyl-tetrahydro-1,2,5-thiadiazole to give aryloxy or 3-pyridoxy substituted piperidines or pyrrolidine. Alternatively the hydroxy group may be reacted with sodium hydride and 2-chloro or 4-chloropyridine to give 2-pyridoxy or 4-pyridoxy substituted piperidines or pyrrolidines.

20

For a compound of formula I in which $-L-Lp(D)_n$ is

- in which Q is a direct bond, reductively alkylating an amine
 5 of formula H-Q using a corresponding compound in which the
 corresponding residue is a ketone of formula

For a compound of formula I in which $-L-Lp(D)_n$ is

- 10 in which Q is methylene, reductively alkylating an amine of
 formula $H-NR_aR_b$ using a corresponding compound in which the
 corresponding residue is an aldehyde of formula

- The intermediates used in the process according to the
 15 invention may generally, when not commercially available, be
 prepared by conventional methods or as described in the
 Examples herein.

For example, methyl 1-acetyl-3-formylindole-6-
 carboxylic acid may be converted to the 3-formate by the

method of Merour et al (Synthesis, 1994, 411) and then reacted with trimethyl orthoformate to give methyl 1-acetyl-3-methoxyindole-6-carboxylate which is then hydrolysed to methyl 1-acetyl-3-methoxyindole-6-carboxylate.

5 5-Fluoroindole-6-carboxylic acid may be prepared from 4-fluoro-3-methoxyaniline by the following method. 4-Fluoro-3-methoxyaniline is treated with glyoxal-1,1-dimethyl acetal and then hydrogenated over Pd/C. The product is N-protected with methanesulphonyl chloride and then cyclised using
10 titanium tetrachloride in toluene. Demethylation with BBr₃ to the phenol followed by reaction with triflic anhydride and then palladium carbonylation in methanol gives the methyl ester, which is then converted to 5-fluoro-1-methanesulphonylindole-6-carboxylic acid by hydrolysis with
15 lithium hydroxide. This 'benzoyl' component may be reacted as previously described and deprotected by hydrolysis with sodium hydroxide at 100°C.

The intermediates disclosed herein, including the novel intermediates of formulae (V), (VI), (VII), (VIII) and (IX)
20 are provided as further aspects of the invention.

The compounds of the invention may be administered by any convenient route, e.g. into the gastrointestinal tract (e.g. rectally or orally), the nose, lungs, musculature or vasculature or transdermally. The compounds may be
25 administered in any convenient administrative form, e.g. tablets, powders, capsules, solutions, dispersions, suspensions, syrups, sprays, suppositories, gels, emulsions, patches etc. Such compositions may contain components conventional in pharmaceutical preparations, e.g. diluents,
30 carriers, pH modifiers, sweeteners, bulking agents, and further active agents. Preferably the compositions will be

sterile and in a solution or suspension form suitable for injection or infusion. Such compositions form a further aspect of the invention.

Total	460 mg

The above ingredients are mixed and filled into hard gelatin capsules in 460 mg quantities.

Formulation 2

Tablets each containing 60 mg of active ingredient are made as follows:

5

Active Ingredient	60 mg

Amino acid derivatives, resins and coupling reagents were

obtained, for example, from Novabiochem (Nottingham, UK) and other solvents and reagents from Rathburn (Walkerburn, UK) or Aldrich (Gillingham, UK) and were used without further purification. All solution concentrations are expressed as %Vol./%Vol. unless otherwise stated.

Purification: Purification was by gradient reverse phase Hplc on a Waters Deltaprep 4000 at a flow rate of 50 ml/min. using a Deltapak C18 radial compression column (40 mm x 210 mm, 10-15 mm particle size). Eluant A consisted of aqTFA (0.1%) and eluant B 90% MeCN in aq TFA(0.1%) with gradient elution (Gradient 1, 0 min. 20%B then 20% to 100% over 36 min., Gradient 2, 0 min. 5%B for 1 min. then 5%B to

20%B over 4 min., then 20% to 60% over 32 min. or Gradient 3, 0 min. 20%B then 20% to 100% over 15 min.). Fractions were analysed by analytical Hplc and MALDI-TOF before pooling those with >95% purity for lyophilisation.

5

Analysis: Analytical Hplc was on a Shimadzu LC6 gradient system equipped with an autosampler, a variable wavelength detector at flow rates of 0.4 ml/ min. Eluents A and B as for preparative Hplc. Columns used were Techogel15 C18 (2x150mm) (Hplc Technology), Magellan C8 column (2.1x150 mm, 5µm particle size) and Luna C18 (2.1x150 mm, 5µm particle size). (Phenomenex) Purified products were further analysed by MALDI-TOF and nmr. NMR denotes an ¹HNMR consistent with the structure was obtained.

Synthesis of inhibitors

Method 1: Using a solid phase strategy on a Protein Technologies, Symphony Multiple Peptide Synthesiser by attachment of bis amino compounds to Peg-trityl chloride resin: Trityl chloride resin was typically treated with greater than 2 fold excess of the di-amine in dry DCM .The resin was further modified by the attachment of acids. Activation of Fmoc protected amino acid (2-5eq) was by TBTU/DIPEA, all couplings (minimum 120 min.) were carried out in DMF. Deprotection of the Fmoc group was achieved with 20% piperidine in DMF. In the next stage other acid substituents were added as the HOBT or HOAt esters either by activation with HBTU/HATU or HATU/EDCI with or without Boc protection of amino groups. Cleavage of the products from the resin was by treatment (30 min., ambient) with 10% triethylsilane in

30

TFA, filtration, evaporation and trituration with diethylether.

Synthesis using the Symphony Multiple Peptide Synthesiser.

5

The Symphony Multiple Peptide Synthesiser is charged with DMF, DCM, TBTU in DMF (450 mM), DIPEA in DMF (900 mM), 20% piperidine in DMF. Resins are held in plastic reaction vessels that allow the introduction of reagents and solvents and nitrogen for agitation or air drying.

10

A typical synthesis cycle on the Symphony is as follows:-

The reaction vessel containing the resin (0.1 mmol) is charged with the Fmoc protected amino acid (0.5 mmol) and then this is dissolved in DMF (2.5ml), treated with TBTU (0.56 mmol, 1.25ml) and DIPEA (1.1 mmol, 1.25ml) and agitated with nitrogen for 2 hours (agitation times may vary). After coupling the resin is washed with DMF (6x 5ml) then deprotected with 20% piperidine in DMF (2x 5ml for 1 min.each, then 1x 5ml for 8 min.) the resin is then washed with DMF (6x 5ml).

Example 1.

1-(2-Amino-4-chlorobenzoyl-D-phenylglycinyI)-4,4'-bispiperidine

25

4,4-Bipiperidine.dihydrochloride (4mmol, 1g) was dissolved in water (5ml) and 2M sodium hydroxide solution (10mmol, 5ml) added. The solution was extracted with ethylacetate (2x 50ml) the combined extracts were washed with water, dried over anhydrous sodium carbonate, filtered and evaporated to give the 4,4 bipiperidine (0.35g) as a white solid. The 4,4

30

bipiperidine was dissolved in dry DMF (2ml) and added to
Peg-tritylchloride resin (0.95 mmol/g, 1.5g) pre swollen in
dry DCM (10ml). After 2h the resin was washed with DCM
(6x5ml), DMF (6x5ml) and DCM (6x5ml). The resin was then air
5 dried to allow aliquots to be taken.

The 4,4 bipiperidine trityl resin (0.1 mmol) was treated
with Fmoc-D-Phenylglycine (0.5 mmol, 187mg), DMF(2.5ml),
TBTU in DMF(1.25ml of a 450mM solution) and DIPEA in DMF
10 (1.25ml of a 900 mM solution). The mixture was agitated with
nitrogen for 2 hours. Deprotection and washing as above.

A solution of 4-chloroanthranilic acid (87mg 0.5mmole) in
dry dimethylformamide (DMF) was treated successively with
15 HOAt (102mg 0.75mmole) and EDCI (115mg 0.6mmole) and stirred
at room temperature for 10min. The mixture was transferred
to the reaction vessel on the Symphony and agitated for 2
hours with nitrogen. The resin was washed with DMF (6x5ml),
DCM (6x5ml) and air dried. The product was cleaved from the
20 resin with 10% triethylsilane in TFA (10ml) for 30 minutes,
the resin filtered off and the TFA solution evaporated to
dryness and triturated with diethyl ether to give the crude
product. The crude product was dissolved in water (10ml),
filtered and purified by preparative reverse phase Hplc.

Method 2: By solution phase strategy: Typically an activated amino acid was treated with an amine (primary or secondary) or alcohol (1eq.). Activation of the protected amino acid (Boc or Cbz protection) was by HATU/DIPEA (1:2) by TBTU/DIPEA (1:2), by HOBT or HOAt and a carbodiimide (EDCI or DCC), or by diethyl cyanophosphonate and triethylamine or DIPEA, all couplings (minimum 120min.) were carried out in DMF without or without dichloromethane as co-solvent. After an aqueous work up the deprotection of the Boc group was achieved with TFA. Other acid substituents were added as the HOBT or HOAt esters either by activation with HBTU/HATU, EDC or DIPCI with or without Boc protection of amino groups. The final products were purified by preparative reverse phase Hplc.

Examples 19-126

The compounds of Examples 19-126 were prepared by the method described below, but using the appropriate starting materials.

Boc D-phenylglycine (251 mg, 1 mmol.) was dissolved in DMF(3ml) with HATU (380 mg., 1 mmol.) and DIPEA(350µl ., 2 mmol.). To this mixture was added 4-methylbenzylamine(121mg., 1 mmol.) and DIPEA (170µl., 1 mmol.). The mixture was stirred overnight. The mixture was then taken up into ethylacetate and washed with water, sodium carbonate solution, water, 10% hydrochloric acid solution and water. The ethylacetate was evaporated without drying and treated immediately with TFA for 30 min. The TFA was then evaporated to dryness and the product triturated with diethylether. TEA(1ml) was added and evaporated to dryness. A solution of 3-hydroxymethylbenzoic acid (76mg , 0.5mmole) in dry dimethylformamide (DMF) was treated with TBTU (161mg., 0.5mmol.) and DIPEA (1.5 mmol.). The mixture was then added to the D-phenylglycine-4-methylbenzylamide (0.5mmol.) and stirred overnight. The crude product was dissolved in water/acetonitrile (20ml), filtered and purified by preparative Hplc to yield pure product.

Preparation of starting materials:

Boc-R-4-(carboxymethyl)phenylglycine

5 **R-4-Hydroxyphenylglycine methyl ester hydrochloride.**

To a dry 250ml three necked round bottom flask, equipped with a low temperature thermometer, a septum for nitrogen coverage and another for introduction of thionyl chloride by syringe, was added R-4-hydroxyphenylglycine (12.5g) and dry
10 methanol (24ml). The mixture was stirred (magnetic stirrer) and cooled to an internal temperature of -20°C using cardice/acetone. Using a syringe, thionyl chloride was added dropwise to the cooled mixture over a period of 10min.
(Care: the reaction of thionyl chloride with methanol is
15 very exothermic and rate of addition should be such that the thionyl chloride is efficiently stirred into the mixture and that the temperature does not rise above -20°C. Once the addition was complete the mixture was allowed to warm to room temperature overnight (16-18hr). Dry ether (150ml) was
20 added and the white ppt. that formed was filtered off, washed with a little more ether and dried. Yield 15.5g 95%.

5 were placed in the glass liner of the Parr reactor and the reactor assembled. The vessel was pressurised to ~10psi with nitrogen and the gas released (repeated five times to remove all oxygen from the system). Carbon monoxide gas was then
10 carefully introduced (use extreme care -the gas cylinder is pressurised to far beyond the bursting disc pressure of the Parr, ideally use a pressure regulator to reduce the pressure to ~100psi) to ~20psi and released three times (into the back of a fume hood). Carbon monoxide was then
15 added to ~100psi and the stirrer started. The vessel was slowly heated to 65°C internal temperature and then stirred at 65°C overnight. (At the early stages more carbon monoxide was added to maintain ~100psi) A sample was removed after 18h and examined by tlc. When complete, the reaction was
20 cooled to ~30°C, the gas released and the vessel flushed five times with nitrogen as before. The reaction mixture was partitioned between ethyl acetate and water and the organic layer washed with 1M hydrochloric acid and then saturated sodium bicarbonate. The solution was dried with MgSO₄ and
25 evaporated. Flash chromatography of the resulting oil gave the product, pure by tlc, 10.6g 90%. Nmr

25 To a solution of Boc-R-4-carboxymethylphenylglycine methyl ester 692mg in THF 10ml was added a solution of lithium hydroxide hydrate 90mg in water 7ml. The mixture immediately became cloudy and over 15min cleared. After 30min, tlc showed the reaction to be complete. Ethyl acetate 20ml and water 20ml were added and the aqueous layer separated. The
30 aqueous solution was acidified with 2M hydrochloric acid and extracted with ethyl acetate (3 x 20ml). The organic

Reagents were obtained from a variety of commercial sources.

IR means an infrared spectrum was obtained. ^1NMR , $^1\text{H-NMR}$, or $^1\text{H NMR}$ means a proton magnetic resonance spectrum was obtained.

In general in this specification, "D-" or "R-" in the name of a product indicates the product was made beginning with a chiral starting material, for example D-phenylglycine; however, racemization may have occurred, and the enantiomeric purity may not have been determined.

1-[D-(+)-Benzyloxycarbonylphenylglyciny]-4-(tert-butoxycarbonyl)piperazine.

(Coupling Method A) D-(+)-Benzyloxycarbonylphenylglycine (58.0 g, 203 mmol) and 1-Boc-piperazine (41.7 g, 224 mmol) were dissolved in DMF (1 L) and cooled to approximately -15 °C in an ice-methanol bath. Diethyl cyanophosphonate (37.0 mL, 244 mmol) was slowly added to the mixture. Triethylamine (59.4 mL, 426 mmol) was added dropwise to the solution. The mixture was stirred at -15 °C for 2 h and was allowed to gradually warm to room temperature overnight. The mixture was diluted with ethyl acetate and water. The layers were separated, and the water layer extracted with ethyl acetate. The organic layers were combined, washed with 10% citric acid (2 x 500 mL) and brine, dried (Na₂SO₄), filtered and concentrated under vacuum. The crude product was filtered through a plug of silica gel (1.2 kg) using 1:1 hexanes:ethyl acetate as eluent to provide 1-[D-(+)-benzyloxycarbonylphenylglyciny]-4-(tert-butoxycarbonyl)piperazine (69.9 g, 76%) as a colorless oil.

Example 291. 1-(3-Aminobenzisoxazole-5-carbonyl-D-phenylglycine)-1'-methyl-4,4'-bispiperidine

To a stirring solution of acetoxime (98 mg, 7.1 mmol) in DMF (5 mL) was added a 1 M solution of potassium tert-butoxide (1.3 mL, 1.3 mmol) in THF. After 2 min, 1-(3-cyano-4-fluorobenzoyl-D-phenylglyciny1)-1'-methyl-4,4'-bispiperidine (303 mg, 0.65 mmol) was added; and, after another hour, the solvent was partially removed and the residue was

partitioned between brine and dichloromethane. The layers were separated and the aqueous phase was extracted another two times with dichloromethane. The combined organics were dried (MgSO₄), filtered and concentrated in vacuo.

IS-MS, m/e 516.0 (M+1)

The residue was then dissolved in ethanol (3.6 mL) and 1 N HCl was added. The stirring solution was heated to reflux.

After 5 h, the heating mantle was removed and after cooling, the solution was diluted ethyl acetate and water.

The pH of the aqueous phase was adjusted to 11 with 2 N sodium hydroxide and extracted twice with dichloromethane. The combined dichloromethane extracts were dried (MgSO₄),

filtered and concentrated in vacuo. The resulting solid was dissolved in a minimum amount of dichloromethane and chromatographed over silica gel, eluting with 2% methanol (containing 2 N ammonia) in dichloromethane through 10% methanol (containing 2 N ammonia) in dichloromethane. The product containing fractions were combined and concentrated in vacuo to give 89 mg (29%) of an off-white solid.

Preparation of Starting Materials

- 15 1-(Boc-D-phenylglyciny1)-4-hydroxypiperidine
(Coupling Method C) To a stirring solution of 1-hydroxy-7-azabenzotriazole (10.24 g, 75.2 mmol) and EDCI (14.42 g, 75.2 mmol) in DMF (160 mL) was added a solution of Boc-D-phenylglycine (18.9 g, 75.2 mmol) in DMF (80 mL). After 10 min, 4-hydroxypiperidine (6.85 g, 67.7 mmol) was added. After stirring over night, the solvent was evaporated in vacuo and the residue was partitioned between ethyl acetate and water. The organic phase separated and washed with saturated aqueous NaHCO₃, followed by brine, dried over MgSO₄, flitered and concentrated in vacuo. Two-thirds of this material was dissolved in a minimum amount of dichloromethane and chromatographed over silica gel, eluting with a gradient of dichloromethane through 1:1 dichloromethane/ethyl acetate. The product containing fractions were combined and concentrated in vacuo to give 15.71 g (94%) of a white foam.

(Deprotection Method D) To a stirring solution of 1-(Boc-D-phenylglyciny1)-4-hydroxypiperidine (5 g, 15 mmol) in dichloromethane (290 mL) was added anisole, (8 mL) followed by trifluoroacetic acid (29 mL). After stirring for 4 h, the solvent was concentrated in vacuo and the residue was suspended with stirring in diethyl ether. After 1 h, the mixture was filtered and the solid was partitioned between ethyl acetate and saturated aqueous $NaHCO_3$. The organic phase was washed with brine, dried with $MgSO_4$, filtered and concentrated to give 0.41 g of white solid. The combined aqueous phase was back extracted with 3:1 chloroform/-isopropanol and this organic phase was separated, dried with $MgSO_4$, filtered and concentrated in vacuo to give 1.6 g of white solid. Enzyme Inhibition assays:

The ability of a test compound to inhibit factor Xa may be evaluated in one or more of the following Enzyme Inhibition assays, or in other standard assays known to those skilled in the art.

Enzyme Inhibition Assay 1

Enzyme assays were carried out at room temperature in 0.1M phosphate buffer, pH7.4 according to the method of Tapparelli et al (J. Biol. Chem. 1993,268,4734-4741). Purified human factor Xa, trypsin, thrombin and plasmin were purchased from Alexis Corporation, Nottingham, UK. Urokinase was purchased from Calbiochem, Nottingham, UK. Chromogenic substrates for these enzymes; pefachrome-FXA, pefachrome-TRY, pefachrome-TH, pefachrome-PL and pefachrome-UK were purchased from Pentapharm AG, Basel, Switzerland. Product (p-nitroaniline) was quantified by adsorption at 405nm in 96 well microplates using a Dynatech MR5000 reader (Dynex Ltd, Billingshurst, UK). Km and Ki were calculated using SAS PROC NLIN (SAS Institute, Cary, NC, USA, Release 6.11) Km values were determined as 100.9µM for factor Xa/pefachrome-FXA and 81.6µM for trypsin/pefachrome-TRY. Inhibitor stock solutions were prepared at 40mM in Me2SO and tested at 500µM, 50µM and 5µM. Accuracy of Ki measurements was confirmed by comparison with Ki values of known inhibitors of factor Xa and trypsin.

In agreement with published data, benzamidine inhibited factor Xa, trypsin, thrombin, plasmin and urokinase with Ki values of 155µM, 21µM, 330nM, 200nM and 100nM respectively. NAPAP inhibited thrombin with a Ki value of 3nM. Compounds

of the invention were found to have activity in these assays.

Enzyme Inhibition Assay 2

5

Human factor Xa and human thrombin were purchased from Enzyme Research Laboratories (South Bend, Indiana, USA). Other proteases were from other commercial sources. Chromogenic para-nitroanilide peptide protease substrates
10 were purchased from Midwest Biotech (Fishers, Indiana, USA).

The binding affinities for human factor Xa were measured as apparent association constants (K_{ass}) derived from protease
15 inhibition kinetics as described previously.^{a,b,c,d} The apparent K_{ass} values were obtained using automated (BioMek-1000) dilutions of inhibitors (K_{ass} determinations are performed in triplicate at each of four-eight inhibitor concentrations) into 96-well plates and chromogenic
20 substrate hydrolysis rates determined at 405 nm using a Thermomax plate reader from Molecular Devices (San Francisco). For factor Xa inhibition, the assay protocol was: 50 µl buffer (0.06 M tris, 0.3 M NaCl, pH 7.4); 25 µl inhibitor test solution (in MeOH); 25 µl human factor Xa (32
25 nM in 0.03 M tris, 0.15 M NaCl, 1 mg/ml HSA); finally, 150 µl BzIleGluGlyArgpNA (0.3 mM in water) added within 2 min to start hydrolysis. Final factor Xa was 3.2 nM. Free [Xa] and bound [Xa] were determined from linear standard curves
30 on the same plate by use of SoftmaxPro software for each inhibitor concentration and apparent K_{ass} calculated for each inhibitor concentration which produced hydrolysis inhibition between 20% and 80% of the control (3.2 nM factor

X_a): apparent $K_{ass} = [E:I]/[E_f][I_f] = [E_b]/[E_f][I^0 - I_b]$.

The apparent K_{ass} values so obtained are approximately the inverse of the K_i for the respective inhibitors [$1/appK_{ass} = app K_i$]. The variability of mean apparent K_{ass} values determined at the single substrate concentration was +/- 15%. The assay system K_m was measured as 0.347 +/- 0.031 mM [$n=4$]; and V_{max} was 13.11 +/- 0.76 $\mu M/min$.

K_{ass} values were determined with thrombin and other proteases using the same protocol with the following enzyme and substrate concentrations: thrombin 5.9 nM with 0.2 mM BzPheValArgpNA; XIa 1.2 nM with 0.4 mM pyroGluProArgpNA; XIIa 10 nM with 0.2 mM HDProPheArgpNA; plasmin 3.4 nM with 0.5 mM HDValLeuLyspNA; nt-PA 1.2 nM with 0.8 mM HDIleProArgpNA; and urokinase 0.4 nM with 0.4 mM pyroGluGlyArgpNA; aPC 3 nM with 0.174 mM pyroGluProArgpNA; plasma kallikrein 1.9 nM with D-ProPheArgpNA; bovine trypsin 1.4 nM with 0.18 mM BzPheValArgpNA.

The ability of a test compound to elongate Partial Thromboplastin Time (Prothrombin Time) may be evaluated in the following test protocols.

Partial Thromboplastin Time (Prothrombin) Test Protocol

Venous blood was collected into 3.2% (0.109M) trisodium citrate vacutainer tubes at 1 volume of anticoagulant to nine volumes of blood. The blood cells were separated by centrifugation at 700g for ten minutes to yield plasma, which was frozen at 70°C until required.

To perform the test, 100µl of plasma was pipetted into in a glass test tube, 1µl of test compound in DMSO was added, and allowed to warm to 37° over two minutes. 100µl of warm (37°) Manchester (tissue thromboplasin) reagent (Helena Biosciences, UK) was added, allowed to equilibrate for two minutes. 100µl of warm (37°) 25mM calcium chloride solution was added to initiate clotting. The test tube was tilted three times through a 90° angle every five seconds to mix the reagents and the time to clot formation recorded. Data from a series of observations and test compound concentrations are analysed by a SAS statistical analysis program and a CT2 (Concentration required to double clotting time) for each compound is generated.

Compounds of the invention were found to significantly elongate the partial thromboplastin time (Prothrombin time).

By way of comparison with the result for the compound of Example 35, 1-aminoisoquinolin-7-oyl-D-phenylglycine-4-(4-fluoro-2-methanesulfonylphenyl)-piperazinamide ditrifluoroacetate salt (a compound within the scope of WO99/11657) was found to double prothrombin time at a concentration of 45 μ M (average of 3 tests).

Alternative Prothrombin Time and APTT Protocols

Coagulation Determinations. Prothrombin Times and APTT values were determined in HUMAN PLASMA with a STA instrument (Stago). BioPT is a special non-plasma clotting assay triggered with human tissue factor (Innovin). Possible binding to albumen or to lipid was assessed by comparing the BioPT effects in the presence/absence of 30 mg/ml human

albumen (HSA) and 1 mg/ml phosphatidyl choline (PC).
Inhibitors were delivered in 50% MeOH vehicle.
